CARBON FOOTPRINT
ORGANIZATION

UNI EN ISO 14064-1:2019 – CORPORATE CARBON FOOTPRINT – 2025

Attention to the environment has always been part of the general framework of corporate governance, and over the past decade, the fight against climate change has inevitably become more important to the company.

Finder, one of the leading manufacturers of electronic and electromechanical devices, is aware that the transition to a climate-neutral economy is a strategic objective of the European Green Deal, so in 2020 it started to carry out an annual GHG (Greenhouse Gas) inventory, and has voluntarily certified its reporting in accordance with ISO 14064-1:2019 with the support of Bureau Veritas.

Since then, there have been encouraging improvements in the environmental indicators, both overall (-30% of tCO_2e in FY 2024 compared to the FY 2019 baseline and -24% compared to the 2023 one) and in relation to production (-25% of tCO_2e in FY 2024 compared to the FY 2019 baseline and -3% compared to the 2023 one).

Head offices, Finder Almese (TO), Italy

The ambitious goal of achieving climate neutrality by 2050 involves:

- the self-production of energy from photovoltaic systems to cover a proportion of internal needs
- purchasing the remaining energy needs almost entirely from renewable sources
- improving efficiency, and upgrading the Group's facilities through more efficient technologies and equipment, high thermal insulation, intelligent lighting and microclimate control systems
- circular economy initiatives such as recovery of packaging and production waste, reuse of by-products;
- projects to offset the environmental impacts of office buildings (planting of trees in defined areas);

Whilst improving and consolidating high standards of manufacturing excellence, Finder continues to invest in raw materials, packaging, and business practices in general that achieve a reduced environmental impact, and a significant recycled content (low carbon). This ensures that indicators such as CO_2e emissions, waste generation and consumption of natural resources continue to decrease in line with global market expectations for sustainability.
