

## UNI EN ISO 14064-1:2019 – CORPORATE CARBON FOOTPRINT – 11/2023

Attention to the environment has always been part of the general framework of corporate governance, and over the past decade, the fight against climate change has inevitably become more important to FINDER.

FINDER, one of the leading manufacturers of electronic and electromechanical devices, is aware that the transition to a climate-neutral economy is a strategic objective of the European Green Deal, so in 2020 it started to carry out an annual GHG (Greenhouse Gas) inventory, and has voluntarily certified its reporting in accordance with ISO 14064-1:2019.

Since then, there have been encouraging improvements in the environmental indicators, both overall (-1.5% of tCO<sub>2</sub>e in FY 2022 compared to the FY 2019 baseline) and in relation to production (-22% of tCO<sub>2</sub>e in FY 2022 compared to the FY 2019 baseline).

Head offices, FINDER Almese (TO), Italy

**The ambitious goal of achieving climate neutrality by 2050 involves:**

- the self-production of energy from photovoltaic systems to cover a proportion of internal needs
- purchasing the remaining energy needs almost entirely from renewable sources
- improving efficiency, and upgrading the Group's facilities through more efficient technologies and equipment, high thermal insulation, intelligent lighting and microclimate control systems
- internal procedures for the progressive reduction of waste, and of the consumption of natural resources.

**FINDER's contribution to the fight against climate change in 2022 included:**

- a saving of 750.9 tCO<sub>2</sub>e from the self-generation of energy from renewable sources
- a saving of over 30 tCO<sub>2</sub>e associated with circular economy initiatives such as recovery of packaging, production waste and the reuse of by-products
- a saving of 5 tCO<sub>2</sub>e through projects to offset the environmental impacts of office buildings (such as planting of trees in designated areas).

Whilst improving and consolidating high standards of manufacturing excellence, FINDER continues to invest in raw materials, packaging, and business practices in general that achieve a reduced environmental impact, and a significant recycled content (low carbon). This ensures that indicators such as CO<sub>2</sub>e emissions, waste generation and consumption of natural resources continue to decrease in line with global market expectations for sustainability.
