Overcurrent (OC and OCm functions)

Functions

- = Output contact 11-14
- OC = Overcurrent
- OCm = Overcurrent with memory
- UC = Undercurrent
- UCm = Undercurrent with memory
- W = Window mode (OC + UC)
- Wm = Window mode (OC + UC) with memory
- H = Hysteresis

If the current moves out of limits, following delay **T2** the output relay turns Off.

When the current is again within limits the Switch-on hysteresis **H**:

- if set in the "without memory" position, the output relay "recovers", i.e. it turns On (after the Switch-on lock-out time) without any memory of the previous event;
- if set in the "with memory" position the output relay remains open.

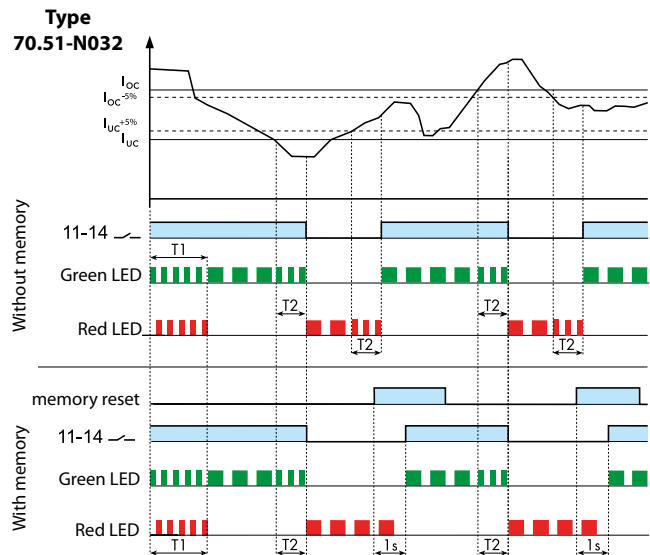

Undercurrent (UC and UCm functions)

To reset, it is necessary to switch the supply Off and then On again, or to push button connected on RESET terminals.

During **T1** delay the relay don't monitoring.

\* The function "with Memory" is only available for type 70.11, 70.31, 70.42 and 70.51.

\*\* It is necessary to switch the supply OFF and then On again (U off U on) or to rotate the function selector first to an adjacent position and then to the original position.
